Re: Application as Sr Software Engineer - CTO - Machine Learning – Analytics

20.06.2018

Job Posting: 19820 — You don't necessarily need to add the job posting info but you can keep it if you'd like.

Dear Hiring Manager:

Titles are usually capitalized.

Think about aligning the date to the left it is usually placed there in a cover letter heading.

I am writing to apply for the position of Software Engineer / Machine Learning at HERE. Since I had the opportunity to attend the lectures in "Connected and automated vehicle systems" by Ralf Herrtwich, who is now Senior VP Automotive at HERE, I became fascinated by the state-of-the-art technology of connected and autonomous driving. Especially fresh 3D maps are an essential foundation. As a current project reviewer of the Path Planning Algorithm project, for the Udacity's "Intro to Self-Driving Cars" Nanodegree program, I am aware of how HERE is leading the field in mapping and localization, and I am pleased to recognize, that it is actively growing. I would be honored to become part of the team.

Because of my interest in autonomous cars, I specialized in Machine Learning and Computer Vision for my Master of Science in Computer Engineering program at the Technical University of Berlin. I've recently graduated and got A+ for my Master's thesis, "Lane and free space detection for environmental perception in self-driving cars" done in cooperation with the Department of Automotive Services and Communication Technologies (ASCT) at the Fraunhofer Institute for Open Communication Systems (FOKUS). Based on my research in machine learning and sensor fusion, I authored a paper "Early Fusion of Camera and Lidar for Robust Road Detection Based on U-Net FCN". The paper was recently accepted at the 2018 IEEE Intelligent Vehicles Symposium (IV2018) and will be published shortly after. As a core element of my implementation, I used an occupancy grid for sensor fusion and for modeling an environmental map.

By being one of the first graduates of Udacity's "Self-Driving Car Engineer" Nanodegree program, I acquired broad knowledge in Deep Learning, Mapping, Planning and Object Recognition and Tracking. Recently, I participated in Udacity's Lyft Challenge, where I adapted and implemented different architectures of Fully Convolutional Networks (FCNs) for a simultaneous car and road segmentation. I was able to provide a solution which was running in real time by using inference optimization and frozen graphs in TensorFlow and Keras. The goal was to accelerate the CUDA-based GPU execution. In the other Nanodegree program projects that I completed, I acquired additional knowledge in Deep Learning: in Convolutional Neural Networks (CNNs) by implementing traffic light or traffic sign classifications. For that project I used Recurrent Neural Networks (RNNs) by implementing a TV script text generation and Generative Adversarial Networks (GANs) by implementing MNIST numbers or human faces generation. After completing and beta-testing Nanodegrees, I am now supporting current Udacity students online as a project reviewer.

During my Master's studies, I gained profound experience as a software developer while as a working student at Siemens Mobility. As part of the ADAS team, I implemented and optimized a computer vision tool based on OpenCV in Python, which provided image augmentations for data preparation and processing for subsequent deep learning applications in real time. Additionally, as part of the EBus team, I independently developed and tested a prototype of control and communication software in C++ based on Modbus and CAN interfaces. I handed over this software to the core developers, and it is used as a hardware abstraction layer in a new embedded Linux charging controller. Previously, I significantly contributed to research and development of the system architecture of the new hard platform and the conceptual design and implementation of the corresponding software tests and release management. Additionally, I was charged with the research and technical description of a cloud-based diagnosis concept. My exceptional commitment and accomplishments as a working student and during my studies were acknowledged by my admission to the Siemens "Future Minds" Student Program.

By becoming a member of HERE, I wish to combine these experiences and my knowledge in the fields of Deep Learning, Computer Vision, and Sensor Fusion. I am looking forward to contributing my skills to the machine learning and analytics team. The entrepreneurial spirit and the will to shape products and implementing pioneering technologies are appealing to me. As I am highly motivated about working in a cooperative open team in an international environment to impact the lives of people every day. I have included my resume with the links to my LinkedIn and GitHub. I am looking forward to your reply. Although, I am currently traveling around the world after graduating from the university, I am always available for a phone interview. I would be happy and honored to become a part of HERE from August on, after my travels. Please consider my application as well for any other suitable positions.

Sincerely, Florian Wulff

Enclosure: CV

There should be a paragraph break after your salutation and below your signature your name should appear in print.

You want to target the position that you want. Leaving yourself open in this way may make it seem like you're not focused or serious about the position you're applying for. It's best to just thank them for considering you for this position vs any open position.

Some companies want to hire right away and including this piece of information could disqualify you if you're up against heavy competition. It's best to leave out this information and only answer if asked in an interview.

You can include your resume as an enclosure.
